

AMENDMENTS TO THE ABSTRACT:

Please amend the Abstract as follows:

ABSTRACT OF THE DISCLOSURE

A ~~main aspect of the invention is based on the idea that~~ a higher degree of freedom in the forwarding process can be obtained by investigating which destinations and/or flows that are represented in a transmitting node (100) and selecting relay direction through a wise choice of destination and/or flow. In effect, the forwarding algorithm ~~proposed by the invention~~ jointly selects i) a relay node among multiple relay candidate nodes and ii) at least one of a) flow among multiple flows and b) destination among multiple destinations. The transmitting node then selects a set of information heading for a selected destination and/or belonging to a selected flow from the transmit queue (110), and finally transmits the selected information to the selected relay node (200). The joint selection process is often based on cost progress, and ~~maybe~~ may be even forward progress in geographic distance. It is however also possible to consider e.g. QoS (Quality of Service) aspects and fairness criteria in the selection process.
